Réseau pommes : BRAEBURN

En collaboration avec l'Office Cantonal d'Arboriculture de
Châteauneuf

BUTS :

- ❖ Observer un réseau de 15 parcelles pendant plusieurs années (7^{ème} année)
- ❖ Publier les tests de pré récolte sur Internet
- ❖ Vérifier la fenêtre optimale de maturité de récolte
- ❖ Observer les conditions climatiques :
- ❖ Cumul de la température moyenne quotidienne depuis le 1 mars fourchette de récolte entre 3400 – 3600°C
- ❖ Suivre l'évolution de la qualité en conservation (AC)
- ❖ Brix (%), Fermeté (kg/cm²), Acidité totale (g/l)
- ❖ Contrôler les maladies de conservation
- ❖ Conditions d'entreposage
- ❖ TP : 0.5-1°C ; HR : 92-94% ; CO₂ : 1.0% ; O₂ : 1.5%.

COMMENTAIRE

FENETRE OPTIMALE DE MATURITE DE RECOLTE

| Fenêtre Braeburn | % Brix | Fermeté kg/ cm ² | Amidon notes 1-10 | Acidité totale g/l | Indice Streif |
|------------------|--------|-----------------------------|-------------------|--------------------|---------------|
| Début | 10.0 | 9.0 | 4 | 8.5 | 0.225 |
| Fin | 12.0 | 8.0 | 6 | 6.5 | 0.111 |

DATES DE RECOLTE

(Optimal pour la majorité des vergers)

Les tests préliminaires de maturité débutent le 20 septembre. La fenêtre optimale de maturité est bonne pour certaines parcelles dès le 4 octobre. Les premières récoltes commencent effectivement le 8 octobre, pour se terminer le 26 octobre 2010. Sur 13 vergers, 11 sont récoltés à la maturité optimale, un verger est récolté trop tôt et un respectivement trop tard. La fermeté moyenne des fruits à la récolte est de 8.7kg, donc supérieure aux 6 années précédentes. Pour les autres paramètres les valeurs sont similaires aux années antérieures.

QUALITE DES FRUITS

(Beaucoup de fermeté et une teneur en sucre normale)

La teneur en sucre des pommes Braeburn se situe dans la moyenne des années précédentes avec des valeurs entre 11.1% et 12.9% Brix en février et une moyenne de 12.0% pour les 13 vergers. En février, les fruits de 11 vergers correspondent aux critères de qualité de la grande distribution, seuls 2 vergers ont une teneur en sucre inférieure à 11.5%. En avril, la

teneur en sucre est quelque peu inférieure, la moyenne atteint 11.8%. Les critères de qualité sont bons pour 9 vergers. L'année se révèle exceptionnelle sur le plan de la fermeté des fruits. Avec une moyenne de 7.7kg en février et de 7.3kg en avril, tous les lots satisfont largement aux critères de fermeté du commerce.

MALADIES DE CONSERVATION

(Très peu de dégât)

En février, pas ou peu de dégât dans les 13 lots. Un début de brunissement de la chair et quelques cavernes sont observés dans certains lots. Des taches amères sont visibles sur 1 lot. En avril, le brunissement de la chair dépasse la limite des 8% dans 1 lot seulement. Le brunissement du cœur est présent mais très discret dans 6 lots, donc sans conséquence pour la consommation. Avec si peu de dégât, l'année est très favorable pour l'entreposage des Braeburn. La commercialisation peut se prolonger jusqu'en mai sans trop de soucis .

RESEAU DE 13 à 18 VERGERS VALAISANS SUIVIS EN CONSERVATION
