## Nutrients

| Nutrients and scores          | Raw burger patties |     |        |             |     |
|-------------------------------|--------------------|-----|--------|-------------|-----|
|                               | Beef               | Pea | Insect | Fungi (mcm) | Soy |
| Energy content, kcal in 100 g | 235                | 269 | 282    | 255         | 169 |
| Protein content, %            | 18                 | 18  | 21     | 21          | 14  |
| Fat, %                        | 20                 | 19  | 19     | 14          | 10  |
| Saturated fat, %              | 8.4                | 5   | 2.1    | 3           | 0.7 |
| Sugar, %                      | 0                  | 0   | 1.4    | 3.0         | 1.2 |
| Dietary fibers, %             | 0.4                | 1.3 | 1*     | 3.1         | 5.1 |
| Sodium, %                     | 1.0                | 1.1 | 1.6    | 1.2         | 1.9 |
| Nutri-Score                   | D                  | C   | D      | B           | B   |

(Smetana et al., 2021)

# LCA of meat and meat substitutes

Raw burger patty, 116 g, from cradle to gate

(Smetana et al., 2021)

0,3 kg of digested proteins, from cradle to plate

(Smetana et al., 2015)

# Microalgae

ORP

$S = 0,1 \text{ ha}$   
 $H = 0,3 \text{ m}$

TBR

IGV GmbH

$S = 0,05 \text{ ha}$   
 $V = 25 \text{ m}^3$

HTF

$S = 10 \text{ m}^2$   
 $V = 2,5 \text{ m}^3$

(Smetana et al., 2017)

# LCA of Microalgae: large differences between systems DIL

FU1 – 1 kg of product; mPt – millipoints (ecopoints, 1 kPt is equal to the annual impact of one European citizen); CORP – open raceway pond cultivation of *Chlorella vulgaris*; SORP – open raceway pond cultivation of *Arthrospira platensis*; CTBR – tubular photo bioreactor cultivation of *Chlorella vulgaris*; STBR – tubular photo bioreactor cultivation of *Arthrospira platensis*; CHTF – heterotrophic fermenter cultivation of *Chlorella vulgaris*

(Smetana et al., 2017)

# Insects

Smetana, Schmitt, Mathys, 2019:  
<https://doi.org/10.1016/j.resconrec.2019.01.042>

# A-LCA of insects

mPt – millipoint, integrated normalized and weighted value of environmental impact

(Smetana, Schmitt & Mathys, 2019)

# C-LCA compound effects of insect production

mPt – millipoint, integrated normalized and weighted value of environmental impact

C – composting avoided

A – avoided anaerobic digestion

### Results

| Category                  | Per unit of raw insects (ton) | For the whole production |
|---------------------------|-------------------------------|--------------------------|
| GWP, kgCO2 eq             | 1901.52                       | 1901.52                  |
| Non-renewable energy, MJ  | 3034.55                       | 3034.55                  |
| Land use, m2              | 73.77                         | 73.77                    |
| Water use, m3             | -0.03                         | -0.03                    |
| Cost, Euro                | 180.93                        | 180.93                   |
| Final product weight, ton | 0.5                           |                          |

### Recommendations

- Use Polyethylene foil (LPDE) as an packaging option to reduce carbon emission and assure the recycling of LDPE
- If freezing, cooling or drying is used- then we recommend to find solutions to eliminate those process. e.g. Application of fresh biomass with pasteurisation
- Use Kraft paper- packaging paper as an packaging option to reduce cost of packaging
- Use microwave drying process to decrease carbon footprint
- Use Brewer spent grains as feed for insects to reduce impact of production by 87.45 %
- By using electricity instead of natural gas can reduce 91.97 % impact

# Modelling efficiency of meat culturing

|                                | Self-organizing                                                        | Scaffold-based                                                | 3D printing<br>(extrusion/droplet)                                                 |
